

2023 ANNUAL DRINKING WATER QUALITY REPORT
Hazen, North Dakota

We are pleased to present the Annual Drinking Water Quality Report. This report is designed to inform you about the safe clean water we deliver to you daily. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of water. On May 21, 2012, we began receiving water from the Southwest Water Authority.

The Oliver Mercer North Dunn (OMND) Water Treatment Plants (WTP) source is surface water obtained from the Missouri River at Renner Bay, about seven miles northeast of the treatment plant on Lake Sakakawea. The quality and condition of this water varies with lake level, spring runoff and other factors. SWA monitors regularly for offensive tastes and odors in the raw water and reduces the taste and odor issues through the addition of ozone. From the Intake, the raw water is pumped to two raw water storage tanks, which are located at the OMND WTP site. The raw water from the tanks enters the treatment plant and runs through the pretreatment filter screens. This helps to reduce any suspended solids or debris from entering the ultrafiltration (UF) modules. The UF process primarily filters out any viruses and bacteria that may be present in the water by maintaining a 4-log removal. The water coming off the UF process is piped to the buffer basin. A portion of the filtrate water from the buffer basin goes through the reverse osmosis (RO) process, which primarily filters out any inorganics that may be present in the water. The permeation coming off the RO process is then blended at a 50/50 or 60/40 ratio with UF water within the contract basin. At this point ozone is added for taste and odor control as well as chloramines to reduce bacteria to a safe level and provide a residual that protects against contamination. Caustic soda is added for a pH adjuster, and fluoride is provided for dental health. After proper detention time and mixing, the water is then pumped through the distribution system to all our customers, including you.

As part of a nationwide program, the North Dakota Department of Environmental Quality completed an assessment of the OMND's source water and determined that our water system is moderately susceptible to potential contaminant sources. They also noted that "historically, Southwest Water Authority has effectively treated this source water to meet drinking water standards." Information about the Source Water Assessment is available by calling 701-225-9149 or 1-800-425-0241 or email at swa@swwater.com.

"I'm pleased to report that our drinking water is safe and meets federal and state requirements" said Jarid Dauenhauer, Water/Wastewater Superintendent for the City of Hazen. If you have any questions about this report or your water utility, please contact Jarid Dauenhauer at 1-701-748-6519. We want our residents and customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held at 5:30 p.m. the first and third Mondays of each month at Hazen City Hall. If you are aware of non-English speaking individuals who need help with the appropriate language translation, please call Jarid at the number listed above.

The City of Hazen would appreciate it if large volume water customers would please post copies of this *Annual Drinking Water Quality Report* in conspicuous locations and/or distribute the report to tenants, residents, patients, students, and/or employees, so individuals who consume the water, but do not receive a water bill, can learn about our water system.

The City of Hazen routinely monitors contaminants in your drinking water according to Federal and State laws. The tables on page 2-3-4 show the results of our monitoring for the period of January 1 to December 31, 2023. As authorized and approved by the EPA, the state has reduced monitoring requirements for certain contaminants to less often than once per year because the concentration of these contaminants is not expected to vary significantly from year to year. Some of our data (e.g., for inorganic contaminants), though representative, is more than one year old.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land, or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, can be naturally occurring or result from urban storm water, industrial or domestic wastewater discharges, oil & gas production, mining, or farming.

Pesticides and herbicides, which come from a variety of sources, such as agriculture, urban storm water runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations, which limits the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

TEST RESULTS FOR THE CITY OF HAZEN

Inorganic Contaminants

Contaminant	MCLG	MCL	Level Detected	Units of Measurement	Range	Date	Violation Yes/No Other Info	Likely Source of Contamination
Arsenic	0	10	1.01	ppb	N/A	2019	No	Erosion from natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes.
Barium	2	2	0.0198	ppm	N/A	2016	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits.
Copper	1.3	AL=1.3	0.181	ppm	N/A	2021	No	Corrosion of household plumbing systems; Erosion of natural deposits.
Fluoride	4	4	0.77	ppm	N/A	2016	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Lead**	0	AL=15	None Detected	ppb	N/A	2021	No	Corrosion of household plumbing systems; Erosion of natural deposits.
Nitrate-Nitrite	10	10	0.051	ppm	N/A	2023	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.

** if present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children.

Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of

Hazen is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. Use water from the cold tap for drinking and cooking. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Microbial Contaminants

Turbidity**	N/A	TT = 0.3	0.04	N/A	2023	100% of samples met turbidity limit.	Soil runoff
-------------	-----	----------	------	-----	------	--------------------------------------	-------------

Surface Water Treatment Rate Monitoring Data: Lowest Monthly Percentage of Samples Meeting Turbidity Limits=100

Highest Single Measurement= 0.07 ** Turbidity is a measure of the cloudiness of the water. The SWWA monitors it because it is a good indicator of the effectiveness of their filtration system. 100% of samples met turbidity limits.

Disinfectants

Contaminant	MRDLG	MRDL	Level	Unit Measurement	Range	Date (year)	Violation Yes/No Other Info	Major Sources in Drinking Water
Chloramines	4	4	2.6	ppm	1.45 – 3.65	2023	No	Water additive used to control microbes

Radioactive Contaminants

Contaminant	MCLG	MCL	Level Detected	Unit Measurement	Range	Date	Violation Yes/No Other Info	Likely Source of Contamination
Radium, Combined	0	5	0.691	pCi/L	N/A	2018	No	Some people who drink water containing radium 226 or 228 more than the MCL over many years may have an increased risk of getting cancer. The likely source of Radium is erosion of natural deposits.
Uranium, Combined	0	30	ND	ppb	N/A	2018	No	Some people who drink water containing uranium more than the MCL over many years may have an increased risk of getting cancer and kidney toxicity. The likely source of Uranium is erosion of natural deposits.
Gross Alpha, Including RA, Excluding RN & U	15	15	ND	pCi/L	NA	2018	No	The likely source of Gross Alpha is erosion of natural deposits.

Stage 2 Disinfection By-Products (TTHM/HAA5)

Contaminant	MCL	High Comp.	Unit Measurement	Range	Date	Violation Yes/No Other Info	Likely Source of Contamination
HAA5	60	11.53	ppb	N/A	2023	No	By-product of drinking water chlorination
TTHM	80	19.61	ppb	N/A	2023	No	By-product of drinking water chlorination

Unregulated Contaminants

Alkalinity, Carbonate	N/A	N/A	4	ppm	4	2023	No	N/A
Bicarbonate as HCO ₃	N/A	N/A	205	ppm	173 -205	2023	No	N/A

The EPA requires testing for certain unregulated contaminants but has not established enforceable drinking water standards for them. They are monitored to determine whether, or not, future regulation is warranted. To obtain information about these tests you may contact Ken Knight, Water Treatment Plant operator (701-225-9149) or Estee Avalos SWA CFO/Office Administrator at 1-888-425-0241 or email at swa@swwater.com.

Total Organic Carbon (TOC) Removal

Contaminant (units)	MCL	Levels Detected	Detection Range	Test Date	Exceedance or Violation	Major Sources in Drinking Water
Alkalinity Source Water (ppm)	N/A	168	142-168	2023	N/A	Natural erosion, plant activities, and certain industrial waste discharges
Total Organic Carbon Source Water (ppm)	TT	4.53	3.28-4.53	2023	N/A	Naturally present in the environment
Total Organic Carbon Finished Water (ppm)	TT	2.43	1.56-2.43	2023	N/A	Naturally present in the environment

Definitions of Terms Used in the Previous Tables:

Not Applicable (N/A)

Parts per million (ppm) or Milligrams per liter (mg/l): one part per million corresponds to one minute in two years or a single penny is \$10,000.

Parts per billion (ppb) or Micrograms per liter (µg/l): one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/l): picocuries per liter is a measure of the radioactivity in water.

Action Level (AL): the concentration of a contaminant, which if exceeded, triggers treatment or other requirements, which a water system must follow.

Treatment Technique (TT): A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Maximum Contaminant Level: The “Maximum Allowed” (MCL) is the highest level of a contaminant that is allowed in drinking water. MCL’s are set as close to the MCLGS as feasible using the best available treatment technology.

Maximum Contaminant Level Goal: The “Goal” (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level Goal: (MRDLG) The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Residual Disinfectant Level: (MRDL) The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

The EPA requires monitoring of over 80 drinking water contaminants. Those contaminants listed in the tables above are the only contaminants detected in your drinking water.

MCLs are set at very stringent levels. To understand the possible health effects described for many regulated contaminants, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist the EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulation is warranted.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as, person with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS, or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbiological contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Our public water system, in cooperation with the North Dakota Department of Health, has completed the delineation and contaminant/land use inventory elements of the North Dakota Source Water Protection Program. Based on the information from these elements, the North Dakota of Health has determined that our source water is moderately susceptible to potential contaminants.

In our continuing efforts to maintain a safe and dependable water supply that will benefit all our customers, it may be necessary to make improvements to your water system. These improvements sometimes require rate structure adjustments.

This report is a yearly update on the quality of water that your city’s water system provides. The City of Hazen works diligently to provide top quality water to every tap. We ask that all our customers help us protect our water resources, which are the heart of our community, our way of life, and our children’s future. Please call our office if you have questions about our city’s water system.
